Cardiac CT Angiography (CCTA with Contrast)

Patient: Noor Yadallee PID-4089 DOB 12 Apr 1956
Modality: Cardiac CT
Performed: Sat Oct 26 2024 04:00:00 GMT+0400 (Mauritius Standard Time)
Facility: St. Jude Cardiovascular Imaging Center
Equipment: Somatom Force 2 192
Interpreting physician: Dr. Arthur Pendelton, MD
Protocol: Retrospective ECG-gated CCTA
Acquisition: 320 slices 3D recon

Summary

Mild non-obstructive calcified plaque in the proximal LAD (Agatston score: 42).

Calcium score

Agatston score 42. Scores under 100 reflect a low cardiovascular event probability over the next decade.

Vessels

Left Main (LMCA): Normal / Patent. Supplies about 70% of the left ventricle. Clear and open.
LAD (Left Anterior Descending): 15 20% Stenosis. Mild focal calcified plaque in the proximal segment. Preserved distal contrast flow.
LCx (Circumflex): Patent / No Plaque. Supplies the lateral heart wall. Clear and open.
RCA (Right Coronary): Patent / Dominant. Supplies the sinus node and right ventricle. Clear and open.

Impression

1. Mild non-obstructive coronary artery disease (CAD-RADS 1): limited to the proximal LAD with mild calcification and minimal luminal compromise. 2. Stable myocardial morphology: normal LV chamber dimensions and preserved wall thickness. No gross ischemia or pericardial abnormalities.

Patient explanation

Noor, your CT scan shows that your major coronary arteries are open and healthy. There is a very mild area of plaque (15 20%) in one small section, which is typical for your age and completely stable. Your medication regimen provides great protection.

CareOS clinical record.
